

One Minute Multiday VWAP Reversal

Maybe you've heard me utter the phrase "that's a **one minute multiday VWAP reversal**" and you have *no idea what I'm talking about*.

Well today, that changes.

On my charts, I technically have TWO lines.

The **blue line** is the most important – that's the 1-minute VWAP, and it's available on most charting platforms.

The **orange line** is the **multiday VWAP** – or multiple time frame VWAP.

For the most part, I use the 1-minute VWAP to help me determine which side of a trade – long or short – to be on.

But what about when a stock breaks the 1-minute VWAP? At that point, how do I determine significant price levels?

That's where the multiday VWAP comes into play.

I don't know all the technical mumbo jumbo behind the multiday VWAP.

In fact, my friend and *Warlock's World* trainer, **SOLIDJELLO** programmed the code CUSTOM for me and all *Warlock's World* members.

The multiday VWAP is roughly an average of the prior day's VWAP and the current day's VWAP.

Significant price levels often become significant again.

As day traders, the VWAP levels that the stock was trading at the day before carry a HUGE significance.

This is what makes the multiday VWAP so important. And so powerful.

Take a look at this recent chart of the **ProShares Ultra Short VIX Futures (UVXY)**...

When a stock moves from the 1-minute VWAP to the multiday – from the blue line to the orange line – that’s what I call a **1-minute multiday VWAP reversal**.

Ta-daa! Now you know what it is!

A handwritten signature in black ink that reads "Kenny Glick". The letters are stylized and cursive, with a prominent vertical line for the letter 'k'.

Kenny "The Warlock" Glick
